

Efficient and Guaranteed Routing in Wireless Sensors Networks

Henry-Joseph Audéoud

Supervised by: Martin Heusse

Second of March, 2017

Université Grenoble Alpes

A little island in the Pacific

A little island — with bases. . .

A little island — with commandos and routes

A little island — with ennemies!

A little island — multi-hop routes

A little island — annoying enemies

A little island — local repair

A little island — but if it fails. . .

A little island — ... we got a loop!

What I really work on

Bases	Sensors
Commandos	Messages
Swamp, montains. . .	walls, corridors. . .
Ennemies	<i>i.e.</i> swinging door
Routing protocol	How to compute the routes?

See you during the poster session!
:)
